

TuringEdge Recovery OS

Team Quick-Start Guide

A simple internal explainer for understanding the product and starting work quickly.

This is the simplest way to understand how the product works so the team can start using, selling, and demoing it.

1. What The Product Does

TuringEdge Recovery OS helps a collections team do five things in one system:

1. Upload a portfolio sheet
2. Turn it into a live campaign
3. Let agents work accounts and capture commitments
4. Track follow-up discipline after a PTP or callback
5. Help supervisors understand what is working and what to change

In short: the product takes a lender spreadsheet and turns it into an operating workflow.

2. The Core Idea

Most collections tools show calls and dispositions.

This product goes one step further:

- It captures borrower commitments like PTP and callback
- It tracks what happens after that commitment
- It shows managers where leakage is happening
- It gives an AI copilot to suggest next actions

The biggest value is not just calling more. It is following through better after the borrower promises something.

3. Main Screens

Login

Users log in based on their role.

Demo credentials:

- admin / admin123
- mgr / mgr123
- agent / agent123
- ceo / ceo123
- cfo / cfo123
- comp / comp123

Early Bucket Control Room

This is the main operating dashboard.

Use it to see:

- total assigned accounts
- contact coverage
- PTP count
- callback count
- missed PTP alerts
- recovery and containment trends
- queue pressure by bucket

Operations Copilot

This is the AI operations layer.

Use it to ask:

- which campaign is working best
- which bucket is leaking
- which agents are performing well
- what strategy should change next

Portfolios and Campaigns

This is where a new sheet is uploaded and launched.

Use it to:

- upload CSV or XLSX
- map fields
- validate quality

- preview records
- launch the campaign

Supervisor Workbench

This is the queue-management screen for supervisors.

Use it to:

- filter by campaign, state, and DPD bucket
- inspect tasks
- move work forward
- rebalance queues
- close or escalate cases

Calling Console

This is the active agent work screen.

Use it to:

- review borrower context
- see transcript or live interaction context
- capture disposition
- save PTP date
- save callback time

Alerts and Compliance

This is the exception-handling screen.

Use it to:

- review missed PTP alerts
- inspect operational issues
- assign and resolve alerts

Reports

This is the reporting and export area.

Use it to:

- generate reports
- schedule reports

- download JSON or CSV outputs

Integrations

This is the reconciliation area.

Use it to:

- review sync issues
- inspect conflicts
- replay failed items
- resolve system mismatches

Users and Access

This is where roles and permissions are managed.

Use it to:

- add users
- manage roles
- control access

4. Simple Product Flow

This is the easiest way to explain the product:

1. A lender gives us a spreadsheet of overdue accounts
2. We upload it in Portfolios and Campaigns
3. We map required fields like customer ID, phone, amount due, and DPD
4. We validate the data and launch a campaign
5. Accounts move into the supervisor queue
6. Agents open accounts in Calling Console and talk to borrowers
7. If the borrower gives a PTP or asks for a callback, the agent saves it
8. The system tracks that commitment and follow-up
9. Managers watch the control room and alerts to see where the operation is slipping
10. The Operations Copilot helps explain what is working and what should change

5. What Each Login Usually Does

Admin

- full product access
- best login for demos and setup
- uses all modules

Collections Manager

- runs the operation day to day
- watches dashboard and copilot
- manages queue and performance

Calling Agent

- works borrower accounts
- captures PTPs and callbacks
- spends most time in Calling Console

CEO

- reviews top-level performance
- uses dashboard, reports, and copilot for oversight

CFO

- reviews recovery and export data
- mainly uses dashboard and reports

Compliance Officer

- reviews alerts and exceptions
- uses alerts, workbench, and reports

6. What Makes The Product Different

- It does not stop at activity tracking
- It focuses on post-PTP follow-through
- It links agent actions to manager control
- It includes an AI copilot grounded in real metrics
- It combines operations, reporting, compliance, and governance in one system

7. Best Way To Demo It Internally

Use this 5-step demo:

1. Log in as admin
2. Upload a portfolio file
3. Launch a campaign
4. Open Calling Console and save a PTP or callback
5. Show the dashboard, alerts, and copilot updating the operating story

8. What The Team Should Remember

If someone asks what this product is, the simplest answer is:

TuringEdge Recovery OS takes a collections sheet, turns it into a live recovery workflow, helps agents capture borrower commitments, tracks follow-up discipline after those commitments, and gives managers an AI control layer to improve results.
